

Project Proposal:

Why someone will need this app?

Nowadays people spend their time online for many activities such as surfing the web, learning new things, watching movies, listening to music and many more. Among these YouTube has taken a significant stage. However there is no application to view the most liked, most commented, most viewed videos ever. YouTube uses a combination of factors including measuring users interactions (number of views, shares, comments and likes). Note that they're not the most-viewed videos overall for the calendar year. Due to this there exists a requirement for an application that can make suggestions to the user. People can look online for the most viewed videos. But by making a system that can recommend saves the user time and streamlines the whole process.

The dataset is available here:

Text Search and Classification dataset:

Trending Videos in Youtube
